Magnum Technical Details and Overview

The stove's working table consists of casted frame and casted hotplate. The firebox is made entirely of casted parts. All casted parts are made of grey cast iron which provides a long lifespan of the product.

The stove's oven is enameled and protected by isolation material. The firebox door, oven door, ashpit door and warming drawer door are casted, in addition to which the oven and firebox doors also have glass elements. There is a thermometer located on the oven's door with a range of 0°-500°C.

Inlet air regulators are located on the ashpit and warming drawer doors, and above the firebox door exists a secondary air inlet regulator through which air goes on the inside of the firebox glass element and prevents from misting and soot buildup on the glass surface. Outside lateral sides, drawer cover and the cooking pan are made of steel sheets and protected with enamel.
